

METAL-PLASTIC COMPOSITE COMPONENTS

Optimum synergy of metal and plastic

The constantly increasing complexity of electro-mechanical assemblies has led to the design of sophisticated hybrid assemblies. We are meeting these new demands through close collaboration with our partner companies, whose longstanding experience in plastic injection molding technology has enabled us to realize innovative parts.

Together with them, we are able to produce various function-based assembly designs as early as the development and design phase.

We would be happy to develop an individual solution for you. G.RAU provides competent advice on all possibilities.
